**Fast Data Technology Makes Employee Internet Management Easier
for IT Departments and Management Alike**

BOULDER, Colo., Sept. 30, 2003 – More and more organizations are recognizing the need to manage employees' Internet use, but installing new Internet management software on a network isn't as simple as it might sound. Recognizing that organizations' networking configurations and software needs can vary a lot, Fast Data Technology, formerly Fatline Corporation, is offering its FastTracker software as an appliance solution on pre-loaded servers.

FastTracker is now available in three options: as an appliance solution, as a managed service through the Internet or as packaged software, giving organizations more installation options than any other Internet management company. Whichever option companies choose, employees and management can quickly and easily access the reports and other information via a Web interface.

"Our focus has always been to make the Internet a business tool to boost productivity and communication. We've never wanted installation or maintenance to be a barrier for companies needing Internet management software. That's why we give our customers options," said Don Gruidel, president and CEO of Fast Data Technology.

The FastTracker appliance solution is a server pre-loaded with the FastTracker software. An organization's IT staff simply installs the server on its network. Once installed, the FastTracker software and support staff do the rest. At this point, it runs just like a managed service over the Internet, so maintenance and service updates are automatic.

The FastTracker appliance solution lessens the burden on an organization's IT staff, so they don't have to buy, install, integrate or maintain the software on their own. Perhaps best of all FastTracker supports many configurations, and its easy administration interface makes it easy for an organization to enforce its acceptable Internet use policy.

Organizations can install the FastTracker appliance solution in their own network environments, regardless of the network configurations. Each pre-loaded appliance runs on an Intel server and can support up to 2,500 users. If an organization has more than 2,500 users, it simply installs additional appliances to support all of its employees.

About Fast Data Technology

Fast Data Technology is an Internet management company with a suite of products powered by patent-pending artificial intelligence technology. Its products include FastTracker and Pure Message. This suite of products has helped businesses increase productivity, reduce bandwidth drain, improve security and eliminate Internet liability concerns. Fast Data Technology also provides search engine solutions that enable corporations to apply artificial intelligence technology for accurate and quick search results. Fast Data Technology is headquartered in Boulder, Colo. For more information visit www.fastdatatech.com.
